From the perspective of AIC, we should take  $p = 3$ . P-values are not significant any more since  $i = 3$ .

## p-values of Ljung-Box statistics

The

test result is only significant at lag 5; thus, the model can be considered sufficient.

5. Model simplification:

```
VARchi(Z, 3, thres=1.96)
```

```
## Number of targeted parameters: 23
## Chi-square test and p-value: 25.28634 0.3356928
```

```
#compare restricted model with normal VAR model
```

When significance level is 0.05, there are 23 parameters are insignificant.  $H_0$  is that all the 23 parameters equals to 0 at the same time. P-value is 0.3356928 which means that we can simultaneously set the 23 parameters to be zero.

The AIC of the unconstrained VAR (3) is -9.576549 and the AIC of the VAR (3) with 23 parameters of zero constraints is -9.599844, so the constrained model is better.
